Rl craft guide install

Setting for Single Player / Client-side SetupInstall Java 64-bit offline Installer (helps for both single Player/Client-side and Server-side setup)Install Minecraft Java EditionInstall Minecraft Forge 1.12.2 latest to %appdata%\roaming\.minecraft (press Windows key and enter %appdata%) Make sure you get the latest 1.12.2 Windows installerInstall Twitch AppOpen the Twitch app and log onInss the latest version of RLCraft Mod in Twitch AppClick Play in Twitch AppGo on the Installations tab in the Minecraft LauncherEdit RLCraftCopy game directory, paste to NotepadClick more optionsCopy JVM arguments paste on NotepadClose Minecraft LauncherOpen Minecraft LauncherGo on the installation tab u Minecraft launcherKlick New... Name it RLCraftChange Version to the Forge version (release 1.12.2-forge1.12.2-14.23.5.2847) ming to the end! Paste the game directory from NotepadKlick several options Paste JVM arguments from NotepadUd confirmation JVM for more RAM while playing the game*NOTE* At the beginning of the text where it says -Xmx4096m -Xms256m tells the game maximum / minimum ram use. I changed them to -Xmx8g -Xms256m so it will now use max 8GB and min 256MB. This ensures that the game runs smoothly. It is also necessary for efficient use of resources/parasol packages with mod. You can enter in megabytes or gigabytes. Click CreateNow yo no longer need to use the Twitch app. Remember that you will need to do this again if you want to update the mod to the latest version. Add Optifine for Performance + Shaders & Resource PacksOpen Twitch AppGo to My ModpacksThat and right-click RLCraftC click Open folderTransming Optifine_1.12.. 2_HD_U_E3.yoke Place moistened file jar u mods folderCreate folder i name it shaderpacksE, bots this was it, that's it.) u resourcepacksRecommended Resource Pack Chroma Hills (download the 1.12 version)AND a shader pack (zip) shaderpacksRecommended Shader Pack Sildur's Shaders (this one is medium, go here to get a different version, but you want i quality)Server GuideInstall Java 64-bit Offline Installer if you haven't already. DO THIS OR WILL NOT WORKNavigate to %appdata%\roaming\.minecraftZase the folder and name it RLCraft ServerSasm minecraft Forge 1.12.2 latest to %appdata%\roaming\.minecraft\RLCraft ServerRun forge -1.12.2-14.23.5.2847-universal.jar file so that the necessary files From now on it should be eula.txt fileOpen eula.txt i change eula=false eula =trueSave the changesDownload the latest RLCraft Server PackRight-click the fileKlick PropertiesCheck the box at the bottom Unblock to ensure everything works on your systemExtract the contents of the zip to %appdata%\roaming\.minecraft\RLCraft Server Open Notepad and paste in : java -Xmx8192m -Xms256m -jar forge-1.12.2-14.23.5.2847-universal.jar nogui*NOTE* Like earlierexplained, 1000 -Xms256m indicates the maximum and minimum RAM the server can use. My example here uses max 8192MB and min 256MB*. Customize accordingly, especially if you are planning to start the server and play on the same computer.*Save this file as All Files and name it run.batSave it to %appdata%\roaming\.minecraft\RLCraft ServerThese are all necessary files to run the server locally. At this point, you can run the server and have your friends join the server or manually add it via ip address. Double-click .bat, and the Command Prompt window must open. If you're planning to connect your friends to your server over the Internet, the best way to connect a 25565 port to your computer and share a public IP with your friends to connect is. Otherwise, use only LogMeIn Hamachi or ZeroTier. Create a network and let everyone join this network before you try to connect to a game server in minecraft. If the IP address of the configuration ip does not work/connects to friends, try the IP address of the computer running from Hamachi. This could work (for my friend). I assume it's because the local IP address is different. Hamachi can slow anyone down, though... I hope this will help. I did this after spending UR yesterday researching YouTube and Reddit posts for CLEAR installation guide... This could be late, so... If I have to make a difference, tell me anything. Enjoy this awesome mod! EDIT #1: If you see The game startup error failed!:P ojdite to url, download the jar file and place it in the directory and overwrite one there. I'm not sure why this happens, but it:) #2: Use the Twitch app to update your mod. Right-click the mod and update the mod profile to the latest version. Make sure that the folder instance is still the title of RLCraft and not something like RLCraft (1). I'm not quite sure about the server, so make a backup. I think you can drag and drop files into the RLCraft server folder, but, personally, I just saved my folder world, saved the run.bat, downloaded the new RLCraft server zip and reinstalled / ran MC Forge 1.12.2.Page 2 38 comments I was having viewed some videos on youtube and I want to play as well. I wrote rlcraft google and as 10 pages download pages found. Can anyone connect a legitimate site/video to help me? Page 2 21 comments In this post we will learn how to install RLCraft. RLCraft is a fantasy ModPack created by Shivaxi. So when installing you want to look for a Modpack that says something like RLCraft Shivaxi. If you want to see more of our RL Craft videos, then you can check them out. There are several ways to install RLCraft, Twitch launcher, Technic launcher and manually. I will not cover the manual process as it is just unnecessarily boring compared to other ways of installing RLCraft.Installing RLCraft using Twitch LauncherTho is the easiest way to RLCraft, as long as it is the launcher is working properly because I have had problems in the past. Problems only require you to wait and try again later in general. Once it works, it's very simple. One thing to note about the Twitch version is that it can sometimes be behind compared to a Technic launcher. That's not always the case, but it's just something I can record. Go and download the Twitch app for WindowsOpen to launch twitch and navigate to the mods at the top. Click on Minecraft.Click Browse Modpacks.In in the top right corner, type RLCraft (no space). Move the mouse button over the RLCraft image, and then click Install. Once installed, go back to mods, click Minecraft.Then click Play and you can play RLCraft, yay! How to install RLCraft Without twitching – Use Technic LauncherTechnical launcher is very easy to use, but you'll need to log in and log off every so often if you're using another launcher. For example, the official Minecraft launcher. Follow the instructions below to install RLCraft using technic Launcher. One thing you need to inform with a technic launcher is that you need to increase your memory. Go and scroll down, then install Technic Launcher from the links below. Once installed, click MODPACKS at the top. In the upper left, look for Shivaxi RLCraftClick on Shivaxi RLCraft and click install down the bottom right. Once installed, you will then be able to click Play.With both of these installations, the game will still take a long time to load correctly. Be patient and it will fill up. If you need additional information about installing RLCraft then check the video above as it is much easier to follow. RLCraft is one of the most popular modpacks for Minecraft and probably the most demanding to play. Thankfully, while the package itself is hard to play with, the installation is relatively simple. Here are two ways to install RLCraft on your computer. Twitch This is probably the easiest way to download the most popular mod packages and is what we recommend to do if you are new to minecraft modding. Start by downloading and installing the Twitch desktop app from your main website. Once the app is installed, start it and log on or create a Twitch account if you haven't already. Screengrab via Twitch When you have the application up and boot, click on the Mods tab at the top of the screen. This will take you to a list of games that can be changed with the app. Click on Minecraft and then select browse modpacks. This will take you to the search page, which will let you browse the most popular modpacks available for the game. Find RLCraft and click on it to install the page. Click on the purple Install button in the upper right corner of the RLCraft page and the application will install it for you. The installation will take a few minutes, but when it's finished, you can go back to the My Modpaki tab. See that RLCraft is installed has a big purple Play button under this. Click Play to open the Minecraft launcher window and start the game as usual. Guide If you want to go using Twitch and install RLCraft manually, there are a few extra hoops you will have to jump through. First you will need to download Forge and RLCraft files. Screengrab via Curse Forge Forge can be downloaded from Minecraftforge.net. RLCraft runs on the latest version of Forge for Minecraft 1.12.2. You can download it yourself or use the .jar that comes with the modpack already. We recommend that you download the latest installer from the website, regardless of whether it can be used with only about any package that uses 1.12.2. Setup is easy to use. Double-click the .jar you just downloaded, and a new dialog box will open. By default, the .minecraft folder must be selected. Make sure you have the Install client check-out box and hit ok to complete the installation. Setup will take a few minutes for all the relevant files to be installed in the root directory of Minecraft. After setup is complete, you can delete it. Forge should automatically install a new Minecraft profile. Go ahead and make sure it's installed correctly. Start the Minecraft launcher, select the new Forge profile from the version menu at the bottom left and start the game. If you did not receive any errors and started a new world without problems, Forge was installed correctly. Screngrab via Curse Forge S Forge installed and works, you can now install the RLCraft package. The package can be downloaded from CurseForge; you will need to use server package 1.12.2. The files must be in .zip folder. After you download package, drag the files to the root directory of Minecraft. The root directory is in C:/.../AppData/Roaming and is called .minecraft. We recommend that you start with a blank mod folder or place all previously installed mods in the security folder before installing RLCraft. Due to the size of the folder and the number of mods in the package, it may take a few minutes for everything to be extracted. Once everything has fallen into the root directory, though, you can play RLCraft as normal. Just open the new Minecraft Launcher, select the Forge 1.12.2 profile and start the game. Play.
